

Specification for HTPA32x31L7.5/1.0HiM(LC)

Rev.2: 2013.02.22 Fg

The HTPA32x31L/_M(LC) is a fully calibrated, low cost thermopile array module, with fully digital SPI interface. The module delivers an electrical offset and ambient temperature compensated output stream, which can be already used for image processing, pattern recognition and presence detection purposes. Object temperatures can be easily obtained by this data stream, a look up table and the calibrated sensitivity constants, which can be found in the EEPROM of the module.

Order Code Example

HTPA32x31L10/1.0HiM(SPI)

Interface: SPI→ SPI device (14bit ADC)
LC→SPI, 12bit ADC, low speed, external processing required
UDP→Ethernet, CAT5 cable connection
UART→RS232-like, Level: 3.3V

Type: A→Application set: comes with GUI, housing, power supply
M→Module: HTPA sensor soldered to PCB, calibrated stream
S→Sensor: HTPA sensor only. Analogous output.

Sensitivity: Hi→Increased sensitivity
Without "Hi"→ Standard sensitivity

Optics:L→focal length: In example L10 = 10 mm focal length.
/→ F-Number: In example /0.8
For optics see also "HTPA standard optics"

Type: HTPA32x31 (Please contact support for all available HTPA and module combinations.

For modules, the recommended type is M(SPI). The advantages are the better ADC resolution, wider input voltage range, wider measurement range.

Pinout

Pin Assignment HTPA32x31M(LC)			
Pin	Name	Description	Type
1	#MCLR	Master clear, negotiated	Digital Input
2	VDD	Positive supply voltage	Power
3	VSS	Negative supply voltage	Power
4	VSS	Negative supply voltage	Power
5	#SS	Slave select, negotiated	Digital Input
6	SDO	Serial data out of module	Digital Output
7	SDI	Serial data in of module	Digital Input
8	SCK	Serial clock	Digital Input
9	MCLK	Master clock, drives HTPA sensor	Digital Input
10	#VD	Valid Data, negotiated.	Digital Output

Specification for HTPA32x31L7.5/1.0HiM(LC)

Rev.2: 2013.02.22 Fg

SPI Interface:

SCK-Frequency: 350 kHz ... 10 MHz

Protocol Specifications:

Data format:	16 data bits
Frame Sync:	None
Module-Selection:	\overline{SS} -Pin
Clock Edge Select:	Serial output data changes on transition from idle to active clock state
SPI Data Input Sample Phase:	Data sampled on transition from active to idle clock state
Clock Polarity:	Idle State is high level, active is low level.

Electrical Specifications:

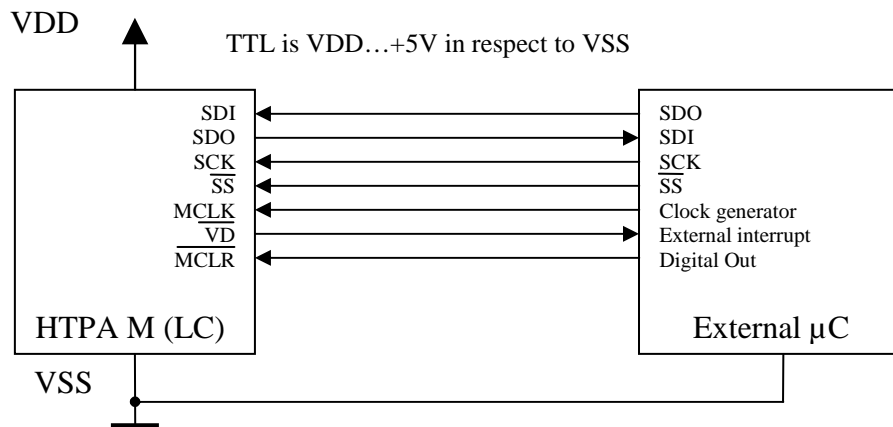

VDD:	Supply (+5.0V DC)
SPI Transmit/Receive:	TTL
VSS	GND
Power Supply:	5.0 VDC +/- 2%, 300mA
IDD (Idle mode)	20 mA
IDD (Operating mode)	45 mA

HTPA32x31L10/1.0M(LC) Optical Orientation of Pixels:

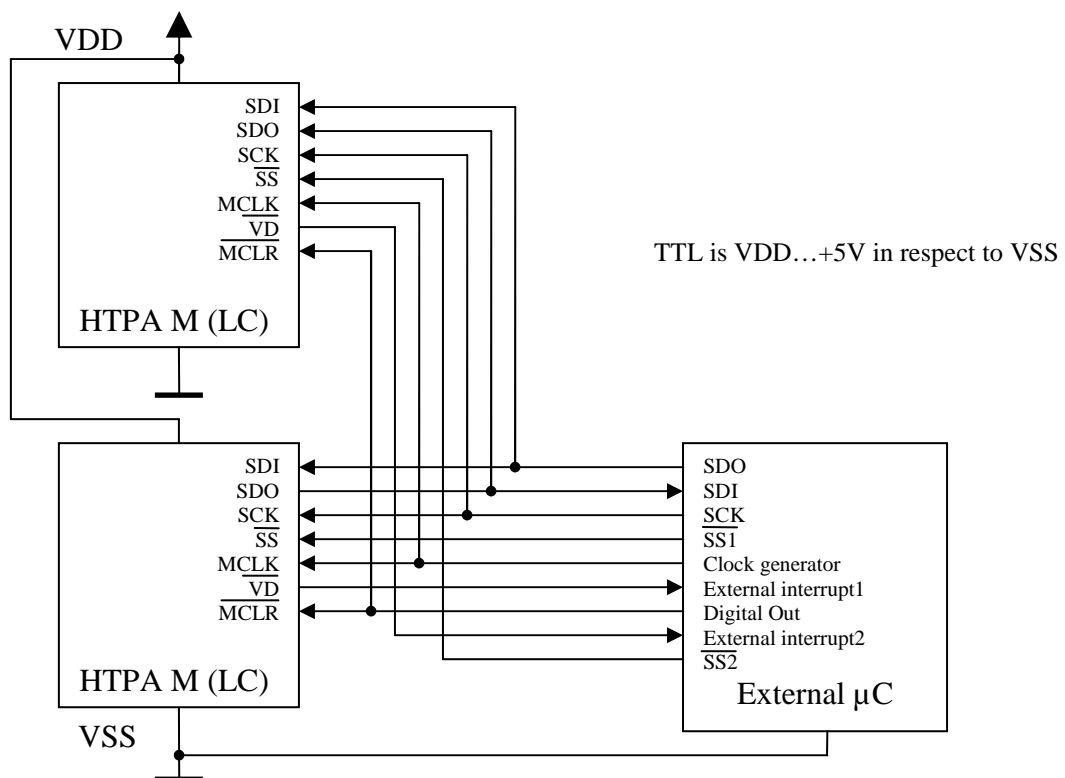

Electrical Connections:

Single Module:

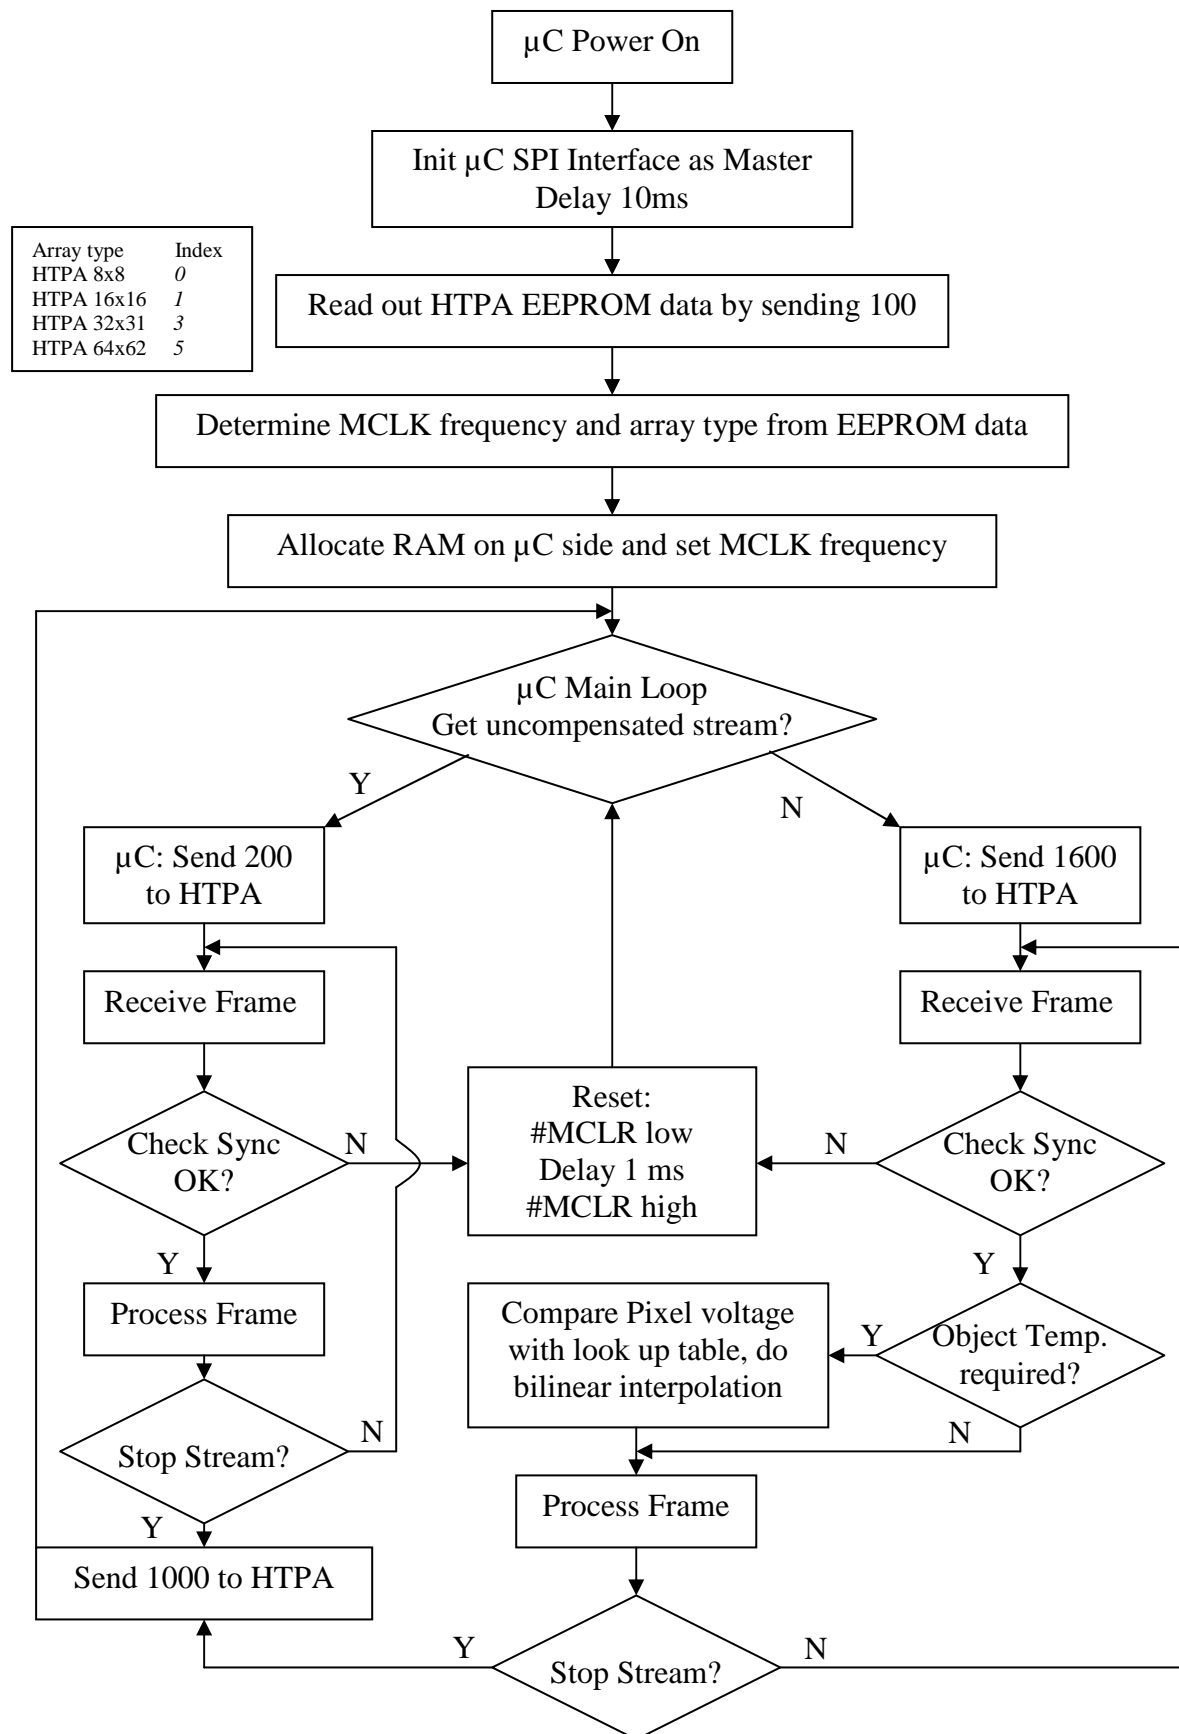

Multiple Modules (preliminary):

Communication and Timings:

Proposed flow chart of communication. (Master is referred as μ C, Slave as HTPA module)

Communication and Timings (continuation):

Receive of command:

(High state of #SS is not necessary, only for communication with multiple devices)

Send of EEPROM content:

Pixel data:

B15...B0: Raw or compensated ADC reading (depending from streaming mode)

Receive of stream command:

For streaming the adequate frequency needs to be applied to the MCLK pin of the module.

Communication and Timings (continuation):

Absolute values:

	MIN	NOM	MAX	Unit	Remarks
MCLR pulse width (low)	2			µs	
t(SSmin)	150			ns	
t(SCK)	0.1	1	2.86	µs	
t(EEacq)	185			µs	
t(framestart)		120		ms	f(MCLK)=1 MHz
t(Pix)		200		µs	f(MCLK)=1 MHz

t(Pix) and t(framestart) depend on the given MCLK frequency of the master. In example: MCLK frequency is 1003 kHz, then t(Pix) and t(framestart) is calculated via

$$t(Pix) = \frac{200}{f(MCLK)} = \frac{200}{1003000} = 199,4\mu s \quad t(framestart) = \frac{t(Pix) \cdot 32 \cdot 33}{2} + 14ms = 119,3ms$$

Important:

The SCK frequency needs to be at least that large, that the 32 bits can be submitted within tPix. Therefore, the following condition must be always true:

$$32 \cdot t(SCK) < t(Pix)$$

EEPROM Mapping:

Overview:

Start address	End address	Data type	Value
0x0	0x3	float	Minimum value of PixC's for scaling
0x4	0x7	float	Maximum value of PixC's for scaling
0x8	0x9		Heimann Sensor reserved
0xA	0xA	char	Table number
0xB	0x33		Heimann Sensor reserved
0x34	0x37	float	PTATgrad
0x38	0x3B	float	PTAToff
0x3C	0x58		Heimann Sensor reserved
0x59	0x5A	unsigned int	MCLK Frequency in kHz
0x5B	0x79		Heimann Sensor reserved
0x80	0x83F	unsigned int	scaled down values of PixC's
0x840	0x3FFF		Heimann Sensor reserved

Important Note:

unsigned int: 2 byte; float: 4 byte; char: 1 byte

All the values are stored (if larger than one byte) in little endian, the so called „Intel-Format“. Example for the MCLK-Frequency:

$$MCLK_{LB} = \text{EEPROM}[0x59] \quad MCLK_{HB} = \text{EEPROM}[0x5A]$$

$$MCLK = 256 \cdot MCLK_{HB} + MCLK_{LB}$$

EEPROM Mapping (continuation):

Details for PixC's:

Start address	End address	Data type	Value
0x80	0x81	unsigned int	scaled PixC value of Pixel 0
0x82	0x83	unsigned int	scaled PixC value of Pixel 16
0x84	0x85	unsigned int	scaled PixC value of Pixel 1
0x86	0x87	unsigned int	scaled PixC value of Pixel 17
0x88	0x89	unsigned int	scaled PixC value of Pixel 2
0x8A	0x8B	unsigned int	scaled PixC value of Pixel 18
...
0xBC	0xBD	unsigned int	scaled PixC value of Pixel 15
0xBE	0xBF	unsigned int	scaled PixC value of Pixel 31
0xC0	0xC1	unsigned int	scaled PixC value of Pixel 32
0xC2	0xC3	unsigned int	scaled PixC value of Pixel 48
0xC4	0xC5	unsigned int	scaled PixC value of Pixel 33
0xC6	0xC7	unsigned int	scaled PixC value of Pixel 49
...
0x83C	0x83D	unsigned int	scaled PixC value of Pixel 975
0x83E	0x83F	unsigned int	scaled PixC value of Pixel 991

Calculation of the PixC's:

1. Determine minimum and maximum value of the PixC's out of the EEPROM data by reading associated EEPROM value into a float constant. Pseudocode in C, see function "getPixC(void);"
2. Now scale all scaled down PixC's out of the EEPROM content back to their original value and store them in RAM of your system.

Formulas:

$$PixC_{MAX} = \text{EEPROM}[0x0 - 0x3] \quad (4 \text{ byte float value in little endian})$$

$$PixC_{MIN} = \text{EEPROM}[0x4 - 0x7] \quad (4 \text{ byte float value in little endian})$$

$$PixC(PixelX) = \frac{\text{EEPROM}[0x80 + (X \cdot 2)] \cdot (PixC_{MAX} - PixC_{MIN})}{65535} + PixC_{MIN}$$

```
unsigned int PixC[992];    //The scaled back PixC's. Most likely, this should be global.
```

```
void getPixC(void)        //this function determines the pixel constants. Precondition: EEPROM content is stored in the char array "EEPROM"
{
```

```
    float common[2], min, max;
    unsigned int addr=0x80; //the start address for the scaled pixel constants
    unsigned int pcl;        //this stores the two bytes from the scaled down PixC out of EEPROM.

    memcpy((char*)&common, (unsigned char*)&EEPROM[0], sizeof(float)*2); //the address of the scaling values for the pixc's
    min=common[0];
    max=common[1];
    for(i=0; i<PIXEL; i++){
        memcpy((char*)&pcl, (unsigned char*)&EEPROM[addr], 2); //include string.h for memcpy
        addr+=2;
        PixC[i]=(unsigned int)((float)pcl/65535.0)*(max-min)+min+0.5);
    }
}
```

```
    return;
```

```
}
```

Specification for HTPA32x31L7.5/1.0HiM(LC)

1054	PTAT7 in digits
1055	no value, ignore

Each dataset consists of a 16 bit value. The 16 bit values are transmitted with LSB first. In case of compensated voltage mode a signed 16 bit value is transmitted, in case of raw voltage mode an unsigned 16 bit value. Signed values are always in 2's complement.

Communication commands:

Sent Command	Answer / Result
100	Output of EEPROM content. Data ready of each 2 bytes is signified by #VD pin.
200	Module streams out uncompensated, raw data stream. Data ready of each 4 bytes is signified by #VD pin.
1000	Stops streaming mode of module.
1600	Module streams offset corrected stream (electrical and thermal). Data ready of each 4 bytes is signified by #VD pin.

Precondition for all streaming modes:

MCLK signal is generated and frequency is in limits shown by the section “Absolute Maximum Ratings”

Preconditions for compensated streams

MCLK signal is generated and frequency matches EEPROM content. Failure of MCLK should be $\leq \pm 3\%$

VDD must be in the given limits (5V $\pm 2\%$). False values for these two may affect calculated absolute object temperatures. False values for the MCLK frequency also may result in pattern formation in frame.

Absolute Maximum Ratings:

Value	MIN	NOM	MAX	Unit	Remarks
TTL Frequency on pin MCLK	MCLK-3%	MCLK	MCLK+3%	Hz	in compensated streaming mode
TTL Frequency on pin MCLK	0.1		1.7	MHz	in raw voltage streaming mode
VDD in respect to VSS	-0.3	5	6.5	V	
VDD in streaming mode	4.9	5	5.1	V	False VDD values affect compensation
Voltage on digital pin with respect to VSS	-0.3		VDD+0.3	V	
Current consumption	37	45	50	mA	In streaming
Current consumption	18	20	25	mA	Idle

Temperature Calculation:

1. Init SPI Interface
2. Read out EEPROM data
3. Determine MCLK frequency, apply to MCLK pin (Refer to EEPROM Mapping)
4. Determine pixel constant PixC for each sensitive pixel, keep them in RAM (Refer also to EEPROM mapping)
5. Enable ISR connected to the #VD pin of the module
6. Write 1600 via the SPI interface to the module
7. Module starts to run and signifies valid data with pull down of #VD
8. In the ISR get 32 bit (2 times 16 bit read) within the given timings from the module
9. These two words represent the compensated pixel voltage of the two corresponding pixels. For serial order of the pixels in frame refer to "Serial order of data in stream"
10. Scale the pixel sensitivity according to the following formula, using the PixC's:

$$V_s(X) = \frac{1E8 \cdot V_c(X)}{PixC(X) \cdot \varepsilon}$$

Where ε is the emissivity of the object, $V_s(X)$ is the sensitivity corrected voltage of pixel X, $V_c(X)$ is the offset compensated voltage of pixel X (submitted by the module).

11. Compare the $V_s(X)$ value with the pixel voltages in the look up table (vertical axis)
12. Calculate the ambient temperature of the sensor out of the given values from the module (see "Serial order of data in stream"). This formula may be used for ambient temperature calculation:

$$T_{AMB} = 4096 \cdot V_c(1027) + V_c(1026)$$

13. Compare the T_{AMB} value with the horizontal axis of the look up table.
14. Do a bilinear interpolation of the 4 neighbour supporting points, where T_{AMB} and $V_s(X)$ intersect.
15. The result is the object temperature in deci-Kelvin [dK].

C-Code for all these calculations can be found in our SDK (Software Development Kit). Furthermore, the SDK is able to fetch the data from the module and sends it to our GUI (Graphical User Interface) which can visualize the data, records videos and text files and has many additional features. For more information see www.heimannsensor.com.

Specification for HTPA32x31L7.5/1.0HiM(LC)

Object and Ambient temperatures in deci-Kelvin [dK]. Pixel voltage in digits [dig]. Insert sensitivity (and emissivity) corrected voltage.

Table Number #12

You can find the matching table number to your device in the EEPROM, refer to "EEPROM Mapping"
