Serial Transmission:

HTPA32x31 Serial Transmission of analogue data

Off0…Off16	Electric offset of amplifier 0 to amplifier 16
Pix0…Pix991	Amplified pixel voltage of Pixel0 to Pixel991
PTAT0…PTAT7	PTAT-Signal

The numeration of the pixels is in all cases line by line.

SPI Communication:

Data sampled at rising edge of SCLK, MSB first.
In case of ASIC as master device the frequency of the SCLK_IO is equal to the frequency of MCLK/2.
The valid sample cycle numbers are expensed in the least 10 bits. The value runs from 0 to 527.

The output drivers for SCLK_IO and DATA_IO are enabled by CONT.
If CONT is low the data can be written serially from external controller through DATA_IO. In that case the external controller has to wait a minimum delay time, until SCLK_IO and DATA_IO output drivers are disabled. After programming, the positive slope of CONT stores the contents, when the number of SCLK-pulses is equal 16. While the output driver of the ASIC is disabled a weak pull up ensures that the SCLK_IO pin is at high level. To execute a reset command, the µC has to write a logical "1" to the R-Bit in to configuration and afterwards a "0" into the R-bit, which requires two write cycles in this special case.
